

Catalog migration change audit

Synthetic demonstration / one source snapshot + one destination snapshot

What changed

4 source SKUs; 3 destination SKUs; 1 absent SKU; 2 changed offer IDs; 4 non-ID field changes. 7 findings in the actionable CSV. Priority is illustrative, not an estimate of revenue risk.

SKU	Observed change	Next action
MUG-W	Missing destination row	Check whether exclusion was intentional
TS-B-S	ID changed; margin label lost	Confirm map; inspect supplied label dependencies
TS-B-M	ID, size and price changed	Verify variant; confirm expected repricing
CAP-R	Availability changed	Compare snapshot times and actual stock

Limits

All records are invented. Rows are matched on unique supplied SKU, never title. Real duplicate or absent join keys require explicit mapping before conclusions. Export comparison does not observe live Merchant Center acceptance, campaign filters, page prices or historical performance. A field change can be intentional.

Comparison evidence

Native diagnostics, a free file checker and the free single-page extension have NOT been run. Incremental actionable findings and time saved remain UNKNOWN. The sample illustrates the output, not superiority over free tools.
